<i>Requirements</i>	2
<i>Configuration</i>	2
<i>Usage</i>	2

Requirements

In order to run this application, the machine need to have the following requirements:

- Python 2.x.x (prefer Python 2.7.10)
- Root privilege to run the script
- The machine that DNS requests are directed to has HTTPD service running.

Configuration

Go to `/etc/httpd/conf` and open the file `httpd.conf`. We will look for the line that is

`Listen 80` and add one more line `Listen 443` as the following:

```
40 #  
41 #Listen 12.34.56.78:80  
42 Listen 80  
43 Listen 443  
44 #  
45 # Dynamic Shared Object (DSO) Support  
46 #
```

After that, we restart `httpd.service`:

```
root$ systemctl restart httpd
```

Usage

First of all, `scapy` module is required in order to run the application. To install `scapy`, type the following command:

```
root$ pip install scapy
```

In order to run the application, victim IP address and router IP address are required. Here is the application usage:

```
python DNSSpoofing.py -v VICTIM [-l LOCAL] -r ROUTER [-re  
REDIRECT]
```

Required arguments:

<code>-v <victimIP>, --victim <victimIP></code>	IP address of the victim
<code>-r <routerIP>, --router <routerIP></code>	IP address of the router

Providing one of the following arguments:

<code>-l <localIP>, --local <localIP></code>	IP address of the local machine. Specify this one if forwarding DNS requests to the attacker machine.
<code>-re <redirectedIP>, --redirect <redirectedIP></code>	IP address of where victim's DNS requests will be directed to.
